

WALL MANAGEMENT SYSTEM

Revision v1.1 & Ric Platter Partnership

Editable slots, sizes & pricing · full queue management · configurable refunds · QR-only · minimal accounting · restaurant menu, food add-ons, sales tracker & perks

Document: AWL/ENG/2026/WMS-SPEC-002 (v1.1)

Supersedes: the affected parts of AWL/ENG/2026/WMS-SPEC-001 & WMS-001

Change set: 7 configurability changes + 1 new partnership module (P01–P04)

Partner: Ric Platter (restaurant venue & collaboration partner)

Version: 1.1 · August 2026

Classification: Internal — Engineering, Product & Partnerships

Assumption to confirm: “105 off” has been read as a **10% discount** on food for artists and visitors. If a different figure or a flat amount was intended, this is the one number to correct — everything else in P04 follows from it.

CONTENTS

1 Change log at a glance

2 Configurability changes (C01–C07)

Slots, sizes, add-on pricing, queue, refunds, QR-only, accounting

3 Ric Platter partnership module (P01–P04)

Menu integration, food add-ons, sales tracker, artist & visitor perks

4 Data model additions

5 Compliance deltas (food, GST-ECO, revenue share)

6 Recommendations & other suggestions

SECTION 1

Change Log at a Glance

Seven changes make the wall more configurable and lighter to run; one new module plugs the restaurant into the product. Each is specified in the sections that follow.

Ref	Change	Type	Affects
C01	Slots fully variable & editable	Config	F01, F02
C02	Slot sizes configurable (dimensions + base price)	Config	F03, pricing
C03	Add-on pricing editable (admin catalog)	Config	F11
C04	Full admin queue management	Enhancement	F10
C05	Configurable cancellation & refund policy	Config	F12, F20
C06	QR-only — NFC removed	Architecture	F15, F21, F22
C07	Minimal revenue & expenditure accounting	Simplification	F18, F19
P01	Restaurant menu & catalog integration	New module	new
P02	Food & restaurant add-ons	New module	F11 extends
P03	Collaboration sales tracker	New module	new
P04	Artist & visitor food perks (10% off)	New module	new

SECTION 2

Configurability Changes

C01 Slots fully variable & editable

The wall is not a fixed board — slot count and layout are admin-owned and change any time.

BEFORE

Grid was already dynamic, but slots were treated as a mostly-fixed seeded layout in the prototype.

NOW

Admin can add, remove, resize and reposition any slot at will; layouts save as reusable templates; only slots with a live/booked artwork are locked during a re-config.

ACTORS

Admin

RULES

A re-config never orphans a live booking (occupied slots carry across). Every structural edit is versioned and written to `audit_log`.

IMPACT

Extends F01/F02; no change to the booking or payment path.

C02 Slot sizes configurable

Sizes are a managed catalog, not a hard-coded S/M/L/XL enum — admin defines each class.

BEFORE

Four fixed size classes with hard-coded base prices (S=600, M=1000, L=1500, XL=2200).

NOW

Admin defines size classes as a catalog row: name, physical dimensions (W×H cm), weight limit and editable base price/day. Add, rename, retire classes; changes apply to future bookings only.

ACTORS

Admin

DATA

`new size_catalog {id, name, w_cm, h_cm, weight_kg, base_price, active}`

RULES

A confirmed booking keeps the price it was quoted; size edits never re-price past bookings (ref F03).

C03 Add-on pricing editable

Add-ons become an admin-managed catalog with editable prices and availability.

BEFORE

Add-ons and their prices were a fixed list in code (NFC 150, photo 800, ...).

NOW

Admin manages an add-on catalog: label, price, who it applies to (artist / visitor / both), active flag. Prices editable any time; food add-ons (P02) live in this same catalog.

ACTORS

Admin

DATA

`new addon_catalog {id, label, price, applies_to, category, active}`

RULES

Removing the NFC add-on follows from C06. A booking locks the add-on price at purchase time (ref F11).

C04 Full admin queue management

The waitlist is a queue the admin fully controls, not just an ordered list the system runs.

BEFORE

Waitlist auto-ordered by priority; admin had limited hands-on control.

NOW

Admin can reorder, promote/demote, remove, add notes, override priority, and force-match any waitlisted artist directly to an opening slot — all actions audited.

ACTORS Admin

RULES Manual overrides sit above the automatic priority rule (Founding → repeat → referred → new); every override is logged (ref F10).

IMPACT Extends F10; force-match reuses the F12 force-book path.

C05 Configurable cancellation & refund policy

Refund rules are data the admin edits, not logic baked into code.

BEFORE

Refund tiers were fixed (full 7+ days, 50% 3–6 days, none <3 days).

NOW

Admin defines the policy: refund tiers (days-before → %), per-slot-type overrides, no-show handling and add-on refundability. The refund engine computes purely from the active policy.

ACTORS Admin

DATA new refund_policy {tier[], per_type_overrides, no_show_rule, addon_refundable}

RULES The policy version in force at booking time governs that booking's refund; the agreement (F20) embeds that version so the artist signs the exact terms.

C06 QR-only — NFC removed

NFC is dropped entirely; QR is the single scan mechanism across the wall.

BEFORE

Every artwork carried an NTAG424 DNA NFC tag AND a QR code; check-in linked the NFC tag; scan tracking counted NFC taps + QR scans; NFC tag inventory was managed.

NOW

QR only. Cheaper, simpler, no tag inventory, no tap-hardware dependence — works on any phone camera. Check-in (F15) links the artwork to a QR; scan tracking (F21) counts QR scans; artwork pages (F22) are reached by QR.

REMOVED NFC tag inventory, NFC linking step, NFC add-on line-item, NTAG references in WMS-001/SPEC-001

TRADE-OFF NFC's tamper-proof crypto auth is lost. QR can be photographed/replaced.

MITIGATION Resolve every QR through a **signed server-side redirect** (short branded URL → signed token → artwork page) so a copied code still lands on the real page; use tamper-evident, branded QR labels and a staff spot-check so a swapped sticker is caught. Risk is low — the target is a public page, not a payment.

C07 Minimal revenue & expenditure accounting

Books are a light ledger for the founder + CA, not an auto-generated P&L; engine.

BEFORE	NOW
Auto-generated monthly P&L; with modelled cost lines and locked periods.	A simple two-list ledger: record revenue entries (bookings, add-ons, food share, sale commission) and expenditure entries (venue share, ops, misc) with a category tag and date; show a running monthly summary; one-click CSV export for the accountant.
ACTORS	Admin / Founder
DATA	new Ledger {id, type(revenue expense), category, amount, note, date, source_ref}
RULES	GST invoices are still issued on transactions (unchanged); heavy P&L; modelling is deferred until volume justifies it (replaces F18/F19 with a lighter model).

SECTION 3

Ric Platter Partnership Module

The wall lives inside a restaurant — this module makes that a two-way engine: the menu becomes bookable add-ons, food orders are attributed to art visits, revenue is shared and tracked, and artists and visitors get a food perk that drives footfall. Blocks are specified in the same lifecycle style as SPEC-001.

P01 Restaurant menu & catalog integration

[Phase 1 manual](#) · [Phase 2 POS](#)

Bring Ric Platter's food, beverage and merch items into the WMS so they can be offered and tracked.

ACTORS	Platter staff / Admin (maintain), System (sync), Artist & Visitor (consume)
LIFECYCLE	item created (Phase 1: manual entry → Phase 2: POS sync) → active in catalog → shown as food add-on (P02) → edited / marked out-of-stock / retired
RULES	Items carry price, category, veg/non-veg flag, availability. Ric Platter owns item data and all food-safety responsibility (FSSAI, §5). Menu lives in the shared <code>addon_catalog</code> under a food category so it reuses the editable-pricing machinery (C03).
DATA	<code>new menu_items {id, name, price, category, veg, available, platter_ref}</code>
EVENTS	<code>menu.updated</code> → refreshes the add-on picker + visitor menu view.
EDGE	Out-of-stock items hidden from ordering in real time; a POS-sync failure falls back to the last good snapshot.

P02 Food & restaurant add-ons

[extends F11](#) · [route POST /orders](#)

Artists (at booking) and visitors (at the artwork page / table) can add food and restaurant items.

ACTORS	Artist, Visitor, Platter kitchen
LIFECYCLE	browse menu → add items → apply perk/discount (P04) → checkout (Razorpay) → order routed to Platter kitchen → fulfilled → sale attributed (P03)
RULES	Ordering reuses the add-on flow (C03/F11). An order carries an attribution token (from the artwork QR or the visit session) so P03 can tie the sale to the art visit. Single or split checkout is configurable.
DATA	<code>new orders</code> , <code>order_items</code> linked to visitor/artist + artwork/table + attribution token.
EVENTS	<code>food.ordered</code> → kitchen notification/print + attribution + ledger entry (C07).
EDGE	Item sells out mid-order → prompt to swap/refund that line; kitchen offline → order queued + staff alerted.

P03 Collaboration sales tracker

[Shared dashboard](#) · [route GET /finance/collab](#)

Track every sale generated through the collaboration and compute the Artwall–Platter revenue share.

ACTORS	Admin (Artwall), Platter (shared view)
LIFECYCLE	attributed order captured → tagged to source (artwork / visit / artist) → aggregated → revenue-share computed → reconciliation report → settlement
RULES	Attribution via the QR/session/booking token (P02). Revenue-share % is admin-configurable per the partnership agreement (§5). Both parties get a dashboard; a reconciliation export drives settlement.
DATA	<code>new sales_attribution</code> , <code>revenue_share_ledger {order_ref, source, gross, art_share, platter_share, settled}</code>
EVENTS	<code>sale.attributed</code> → revenue-share ledger + dashboards.
EDGE	Disputed/duplicate attribution flagged for manual review; refunds reverse the matching share entry.

P04 Artist & visitor food perks

[Perk · confirm 10%](#)

A partnership perk — 10% off food (assumption, confirm) plus food add-ons — for artists and visitors, to drive footfall and cross-sell.

ACTORS	Artist, Visitor, System
LIFECYCLE	eligibility check (artist = active booking; visitor = registered/scanned) → perk auto-applied at food checkout (P02) → usage capped per visit/booking → redemption tracked
RULES	10% off food add-ons (confirm figure). Admin sets the rate, eligibility and caps; who bears the discount cost (Artwall, Platter, or split) is defined in the revenue-share agreement (\$5). Abuse controls: one active perk per visit/booking; time-boxed.
DATA	new perk_redemptions {id, principal, kind, order_ref, value, at}
EVENTS	perk.redeemed → discount applied + tracked against the share ledger (P03).
EDGE	Perk stacking blocked unless admin allows it; expired/over-cap redemptions rejected cleanly.

SECTION 4

Data Model Additions

New and changed tables introduced by this revision. Existing tables from SPEC-001 §4 are unchanged except where noted.

Table	Purpose	Key columns
size_catalog	Editable slot size classes (C02)	id, name, w_cm, h_cm, weight_kg, base_price, active
addon_catalog	Editable add-ons incl. food (C03, P01)	id, label, price, applies_to, category, active
refund_policy	Configurable cancellation rules (C05)	tier[], per_type_overrides, no_show_rule, addon_refundable, version
ledger	Minimal revenue/expense entries (C07)	id, type, category, amount, note, date, source_ref
menu_items	Ric Platter menu (P01)	id, name, price, category, veg, available, platter_ref
orders / order_items	Food & restaurant orders (P02)	id, principal, artwork_ref, attribution_token, status, items[]
sales_attribution	Ties orders to art visits (P03)	order_ref, source, artwork_id, visit_id
revenue_share_ledger	Artwall–Platter split (P03)	order_ref, gross, art_share, platter_share, settled
perk_redemptions	Perk usage & caps (P04)	id, principal, kind, order_ref, value, at
queue_overrides	Admin queue actions (C04)	waitlist_id, action, actor, note, at

Removed by C06: the NFC tag inventory table and NFC-linking columns on checkins.

SECTION 5

Compliance Deltas

Selling food through the platform introduces obligations the art-only WMS did not carry. These are additions to SPEC-001 §5–§6, not replacements.

5.1 Food safety (FSSAI)

- Ric Platter is the licensed Food Business Operator and carries all **FSSAI** responsibility for food quality, hygiene, allergens and labelling.
- Artwall acts only as a digital channel/marketing surface; the WMS surfaces Platter's item data and a clear “prepared and sold by Ric Platter” disclaimer at the point of order.

5.2 GST — e-commerce operator treatment

- **This is the one to get a CA's sign-off on.** If Artwall **collects payment** for restaurant service supplied through the platform, it may be treated as an **e-commerce operator** and, under GST Section 9(5), become liable to pay GST on that restaurant service — a different treatment from Artwall's own slot/add-on revenue.
- Two models to weigh: **(a) Artwall collects** (simpler UX, ECO/TCS + 9(5) implications) vs **(b) Platter bills the food directly** and Artwall only applies the perk + tracks attribution (lighter tax footprint). The choice drives P02 checkout design.

5.3 Partnership contract & settlement

- A written **revenue-share agreement** with Ric Platter must fix: the share %, who bears the P04 perk cost, attribution rules, reconciliation cadence, dispute handling, data-sharing scope and term/exit.
- If Artwall collects and splits payments, use a **split-settlement** payment setup (e.g. Razorpay Route) so each party's share settles automatically and is auditable.

5.4 DPDP additions

- **Food preferences are personal data** and dietary choices can imply sensitive traits (e.g. religion) — collect the minimum, never profile on them, and keep them under the same consent + retention rules (SPEC-001 §5/§8).
- Sharing any personal data with Platter is a **processor/joint-processing** arrangement — covered by the data terms inside the partnership contract; share attribution by pseudonymous token, not raw customer identity, wherever possible.

5.5 Consumer protection

Order accuracy, food descriptions and allergen information are Platter's responsibility surfaced through the WMS; refund/return for food follows Platter's policy, shown clearly at checkout and kept separate from the slot-refund policy (C05).

SECTION 6

Recommendations & Other Suggestions

Beyond what you asked for — the things a senior review would raise now, while they are cheap to build in.

On the partnership

- **Confirm the perk first.** The whole of P04 hinges on the “10%” and on who pays for it. Nail the number and the cost-bearer before building the discount engine.
- **Use split-settlement from day one.** Razorpay Route (or similar) auto-splits each food order between Artwall and Platter — no monthly manual reconciliation, no trust gap, clean audit trail.
- **Make attribution airtight.** Bake a signed table/session token into the artwork QR so a food order reliably ties to the visit that drove it. Attribution you can defend is what makes the sales tracker credible to Platter.
- **Start the menu manual, integrate the POS later.** A manually-maintained menu ships in days and proves the loop; wire up Platter's POS (Petpooja/Posist-class systems are common in India) only once volume justifies it.
- **Design for a flaky restaurant network.** Order capture should tolerate patchy in-venue wifi — queue locally and sync, so a dropped connection never loses a sale.

On operations & product

- **Kitchen routing matters.** Decide early how an order reaches the kitchen — a printed ticket or a simple kitchen-display screen — or staff will chase orders on their phones.
- **Ship an “Art + Plate” combo.** A curated pairing (a featured artwork + a signature dish at a set price) is a natural cross-sell and a strong content/marketing hook for the wall.
- **Guard the perk against abuse.** One active perk per visit/booking, time-boxed, and never stackable unless admin opts in — already in P04, worth enforcing server-side.
- **Keep the founder ledger genuinely minimal.** Resist rebuilding the P&L.; A tagged revenue/expense list with CSV export (C07) is enough until an accountant asks for more — then integrate Tally/Zoho Books rather than hand-rolling.

On the QR-only decision

- **Sign your QRs.** Resolve every code through a signed short-URL redirect so a photographed or swapped sticker still lands on the real page — this recovers most of what NFC gave you, at no hardware cost.
- **Make QRs tamper-evident.** Branded, hard-to-peel labels plus a line on the staff check-in checklist (F15) to confirm the QR is intact catches the one real risk — a malicious sticker swap.

Sequencing

Suggested order: ship the configurability changes (C01–C07) first — they are low-risk and make the wall easier to run today — then the partnership in two steps: P01+P02 (menu + ordering with manual menu and direct Platter billing), then P03+P04 (attribution, revenue share and perks) once the money split and contract are settled.

References: AWL/PRODUCT/2026/WMS-001 (feature plan), AWL/ENG/2026/WMS-AUDIT-001 (audit pack), AWL/ENG/2026/WMS-SPEC-001 (production & compliance spec). This revision (v1.1) supersedes the affected parts of those documents. The GST e-commerce-operator position (§5.2) and the “10%” perk (P04) are the two open items to close before build.
